Hedera Apex 2026

EcoSwarm Regen

Verified milestone payouts for community climate projects on Hedera.

Theme 3: Sustainability | **HCS + HTS + A2A**

This is not a dashboard. It is a payout operating system for sponsors, verifiers, and local operators.

Narrow wedge

Results-based restoration and resilience funding

Real Hedera usage

HCS topic: 0.0.8316245
HTS tokens: 0.0.8316246, 0.0.8316247, 0.0.8316248, 0.0.8316249

Live public demo path

https://olive-biol-interactions-combination.trycloudflare.com
A2A card and chat are exposed publicly.

Operator agent

Natural-language case operations, release actions, and machine-to-machine A2A surface.

PROBLEM

Climate funding breaks between proof and payout.

Capital often reaches local projects too late because sponsors, verifiers, and operators do not share one trusted workflow.

Fragmented proof

Evidence arrives in documents, chats, spreadsheets, and photo folders that sponsors cannot trust at release time.

Slow sponsor release

Funders hold capital longer because each milestone becomes a custom manual review exercise.

Verifier bottlenecks

Verifiers operate off-platform, which creates more coordination overhead and less repeatability.

Weak auditability

Most products report impact after the fact instead of helping release money with confidence.

The result is slow funding, fragmented trust, and underfunded local climate action.

WEDGE

Start narrow: verified milestone payouts for community climate programs.

The product is designed around one launch wedge instead of a generic sustainability marketplace.

- Sponsor-ready
- Proof-backed
- Repeatable

Field proof -> payout memo -> verifier review -> sponsor authorization -> tranche release

Reforestation

Survival checkpoints, field verification, and staggered releases tied to proof completeness.

River cleanup

Municipal or CSR funds can release against verified collection, routing, and completion evidence.

Community solar resilience

Working capital and follow-on release can be anchored to installation and service milestones.

PRODUCT

A finished multi-workspace product, not a one-page demo.

Every page is synchronized around the same payout case and the same Hedera-backed audit line.

Overview

Portfolio, platform signals, and the top release queue.

Case Room

Shared sponsor, verifier, and operator view for one milestone case.

Operations

Intake, release recommendations, and treasury actions.

Client Portal

Sponsor commitments, release alerts, and approval framing.

Audit Trail

Proof packets, readable event stages, and Hedera checkpoint history.

Agent workspace attached to live case state

Client + operator + verifier stay in sync

Treasury actions are repeatable

Audit stays visible

HEDERA FIT

Hedera is part of the operating model, not a logo on the last slide.

The workflow depends on many low-cost, ordered, repeatable state changes.

HCS checkpoints

Proof intake, payout memo creation, verification, authorization, and release are all cheap enough to anchor repeatedly.

HTS-linked receipts

Impact receipts map financial actions to environmental outcomes instead of stopping at internal status flags.

Low-fee recurrence

The business case only works if updates can be frequent, auditable, and financially realistic.

Agent surface

A2A endpoints and a public agent card make the operator layer machine-readable.

DEMO PROOF

One flagship case. One release workflow. One audit line.

Judges should only have to remember a single case moving end to end.

1

1. Proof packet arrives

Operator submits a milestone-backed project with proof confidence and counterparties.

2

2. Case Room synchronizes

Sponsor, verifier, and operator align around the same release packet and next action.

3

3. Agent dispatch

The operator agent explains the case and triggers the next eligible operational step.

4

4. Client release alert

Sponsor sees a release-ready case instead of a generic analytics panel.

5

5. Hedera audit trail

The workflow ends on visible Hedera-backed proof and treasury checkpoints.

What judges should see on screen

Overview -> Case Room -> Agent Network -> Blueprint -> Client Portal -> Audit Trail

What judges should hear

"This release moves only when proof is visible, review is complete, and payout authorization is explicit."

What judges should remember

EcoSwarm removes trust friction from milestone climate payouts instead of adding another reporting dashboard.

DEPLOYABILITY

This can launch because the buyer, verifier, and operator already exist.

EcoSwarm replaces a broken release workflow instead of inventing a new abstract category.

Buyer

CSR teams
Adaptation funds
Municipal resilience programs

Value: fewer manual release cycles, stronger auditability, and faster confidence to disburse.

Operator

NGOs
Cooperatives
Local delivery partners

Value: clearer milestone expectations, faster working-capital release, and less sponsor back-and-forth.

Verifier

Field auditors
MRV providers
Environmental review groups

Value: structured review queues, visible proof packets, and repeatable release checkpoints.

Repeat-use loop: more cases -> more verification checkpoints -> more release actions -> more Hedera writes -> stronger treasury data -> better case ranking.

ROADMAP

Make the next 90 days concrete.

The project is strongest when pitched as a pilot-ready workflow, not a fully generalized climate platform.

Next 90 days

1. Pilot one wedge in one geography.
2. Add production proof upload and policy checks.
3. Add sponsor approval and recurring treasury deposit flow.
4. Onboard one verifier workflow and one operator class.
5. Keep the agent layer focused on triage, review, and release actions.

Next 6 months

1. Launch first live funded case.
2. Add partner reporting and post-release monitoring.
3. Expand from one wedge to adjacent restoration and resilience programs.
4. Externalize agent-to-agent handoffs when there is real partner demand.
5. Turn repeat usage into a measurable Hedera growth story.

Incubator Ask

We want one operator, one verifier, and one sponsor class to prove faster trusted payouts for real community climate work.

What we need

Pilot access
Verifier partnerships
Design partners for deployment

This is now a product-development problem, not an ideation problem.

What we already proved

Working multi-page product
Real Hedera topic + tokens
Public A2A agent surface
Live sponsor / verifier / release workflow

Why now

The market already has climate programs, proof friction, and slow release cycles. EcoSwarm slots into that gap directly.

GitHub: Ecoswarm

Public backend: trycloudflare demo path

HOL path: code-ready, broker-blocked

EcoSwarm Regen

Hedera-native verified milestone payouts for climate programs.
